Setting up Your System with IllumiDesk and Anaconda

Ensuring you have the right tool for each project

Objectives

Students will be able to...

- Navigate to and within IllumiDesk
- Decide when to work locally or in IllumiDesk
- Access lessons and lab solutions using GitHub
- Use Anaconda, Jupyter and VS Code for data science

Two groups of Canvas courses

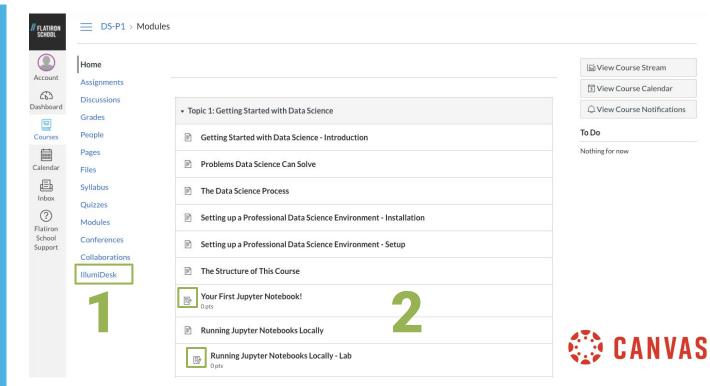

Is used in the Phase courses

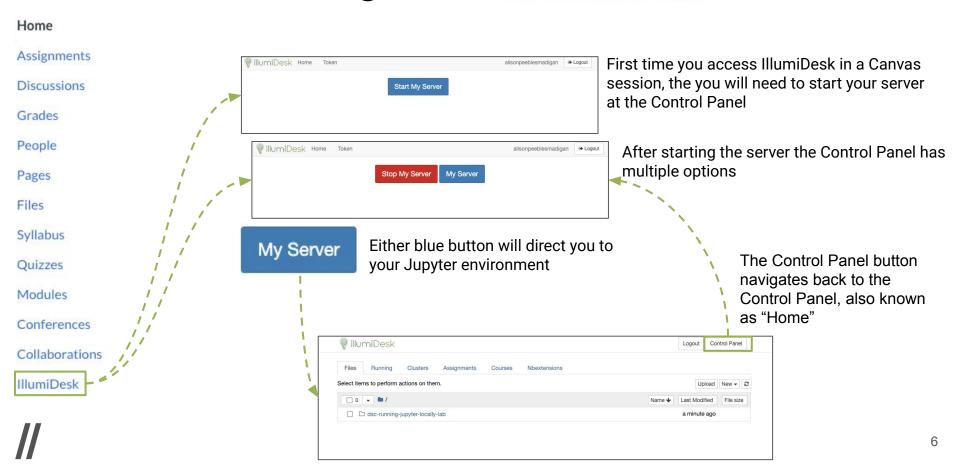

Two ways to access

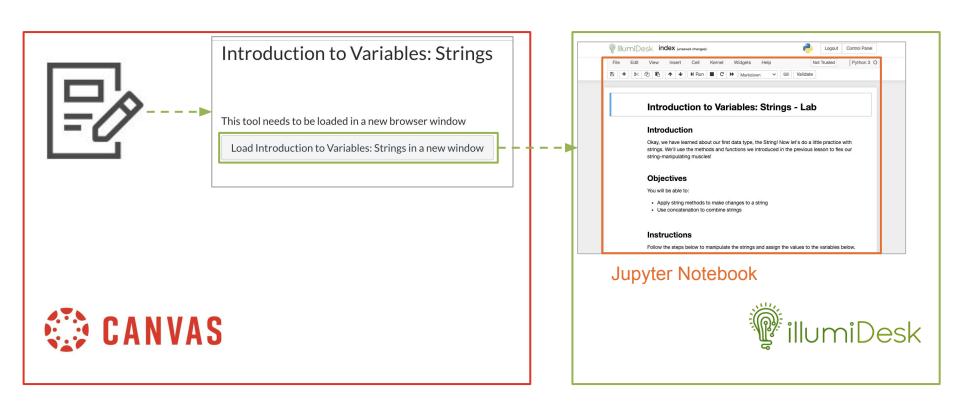

IllumiDesk through the IllumiDesk link

IllumiDesk through Assignment links

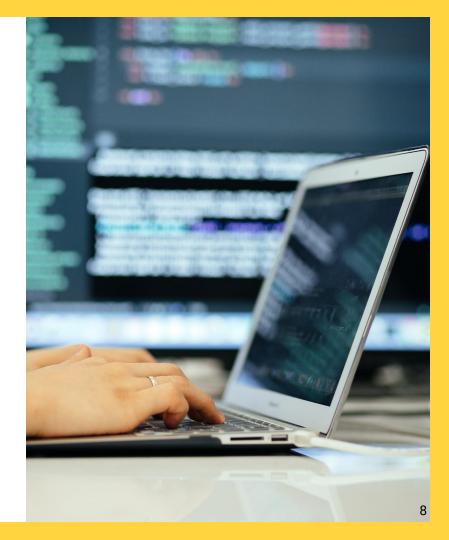

IllumiDesk Structure

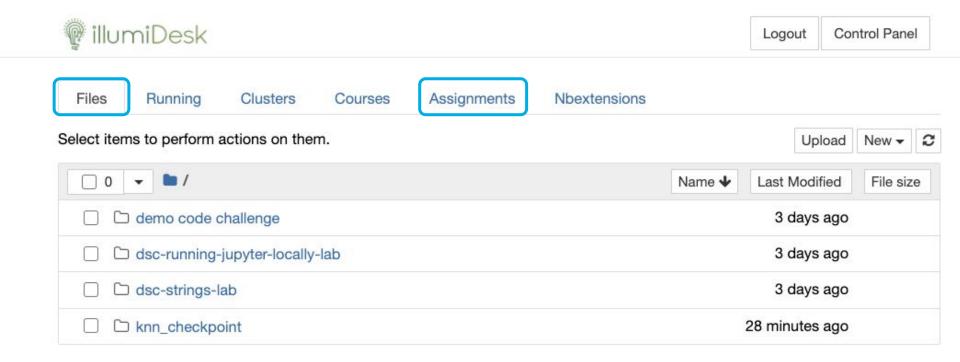

Every Jupyter Notebook opened through an assignment link lives in your Files tab, and will save your work.

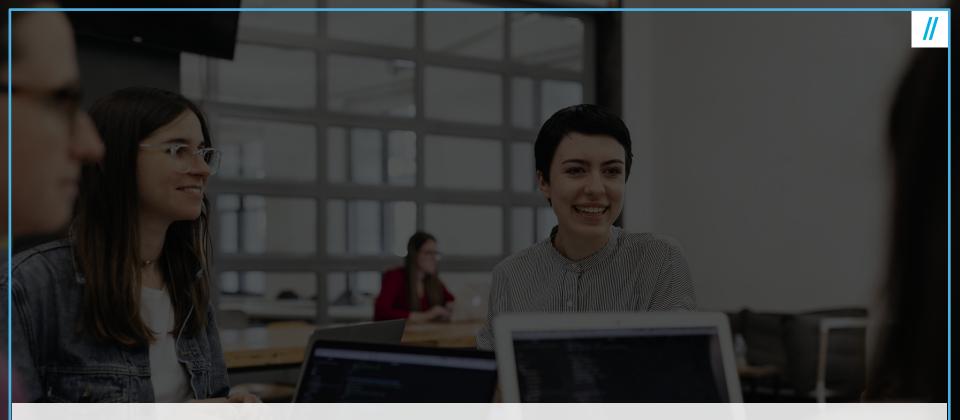

Only two tabs matter for now

Wait - should we do labs in IllumiDesk or clone them to a local environment?

Advantages of GitHub

Employers look for comfort using git

A "green" robust github commit history

Content accessible after the program

It is what you will be using in the real world

Built for collaboration

Advantages of IllumiDesk

Ease of use

No environment issues

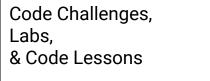

Fully integrated into Canvas

You will use both

GitHub

IllumiDesk

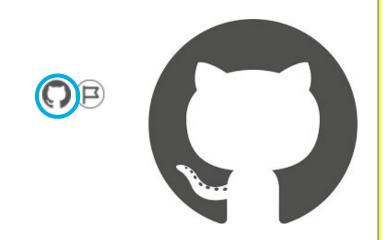

Every lesson with code is stored on GitHub

Introduction to Variables: Strings

This tool needs to be loaded in a new browser window

Load Introduction to Variables: Strings in a new window

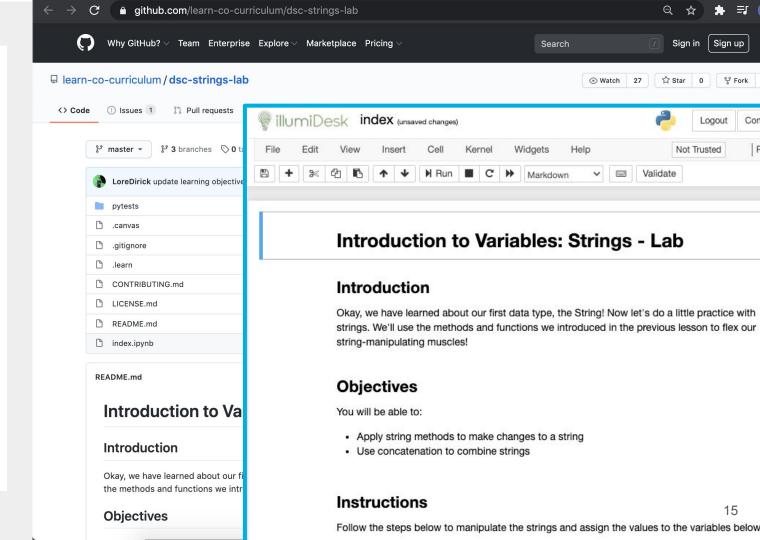

The GitHub logo in Canvas will navigate to the lesson's GitHub repository

You fork and clone the source material from GitHub to your own machine.

(instructions to come)

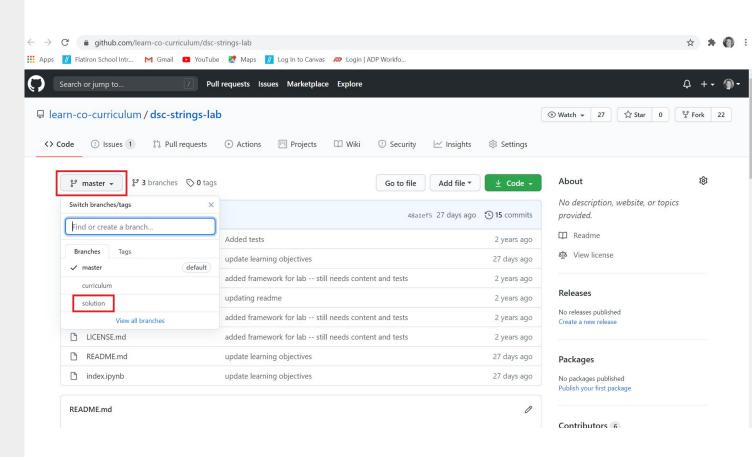

Lab solutions are on the "solution" branch of each repository.

(we will teach you what that means soon)

        Explicit is better than implicit.
        Simple is better than complex.
        Complex is better than complicated.
        Flat is better than nested.
        Sparse is better than dense.
        Readability counts.
        Special cases aren't special enough to break the rules.
        Although practicality beats purity.
        Errors should never pass silently.
        Unless explicitly silenced.
        In the face of ambiguity, refuse the temptation to guess.
        There should be one -- and preferably only one -- obvious way to do it.
        Although that way may not be obvious at first unless you're Dutch.
        Now is better than never.
        Although never is often better than *right* now.
        If the implementation is hard to explain, it's a bad idea.
        If the implementation is easy to explain, it may be a good idea.
        Namespaces are one honking great idea -- let's do more of those!

Python

"Python, named after the British comedy group Monty Python, is an interpreted, interactive, object-oriented programming language.

Its flexibility allows it to do many things, both big and small.

Python can be used to write simple programs, but it also possesses the full power required to create complex, large-scale enterprise solutions." - Derrick Kearney

Python is an Object Oriented Programming language, however, unlike Java...

Python for Data Science

"The usefulness of Python for data science stems primarily from the large and active ecosystem of third-party packages:

- <u>NumPy</u> for manipulation of homogeneous array-based data;
- <u>Pandas</u> for manipulation of heterogeneous and labeled data;
- <u>SciPy</u> for common scientific computing tasks;
- <u>Matplotlib</u> for publication-quality visualizations;
- <u>Jupyter</u> for interactive execution and sharing of code;
- <u>Scikit-Learn</u> for machine learning, and many more tools..."
- Jake VanderPlas

What is **Anaconda?**

"The open-source Anaconda Distribution is the easiest way to perform Python/R data science and machine learning on Linux, Windows, and Mac OS X. With over 15 million users worldwide, it is the industry standard for...enabling individual data scientists to:

- Quickly download 1,500+ Python/R data science packages
- Manage libraries, dependencies, and environments with Conda"

Anaconda DistributionPackage List

CONDA

- Conda is an open source package management system and environment management system that runs on Windows, macOS and Linux.
- Conda quickly installs, runs and updates packages and their dependencies.
- Conda easily creates, saves, loads and switches between environments on your local computer.
- You'll create conda environments to share, collaborate on, and reproduce projects with specific versions of particular packages.
- Source: Conda Documentation + Managing Environments Documentation + conda cheat sheet

What is Jupyter?

Jupyter

- Project Jupyter exists to develop open-source software, open-standards, and services for interactive computing across dozens of programming languages.
- <u>Jupyter Notebook</u> is an open-source web application that allows you to create and share documents that contain live code, equations, visualizations and narrative text.
 - Uses include: data cleaning and transformation, numerical simulation, statistical modeling, data visualization, machine learning, and much more.
- <u>JupyterLab</u> is a next-generation web-based user interface
- Share notebooks using <u>nbviewer</u>

What is Visual Studio Code?

Visual Studio (VS) Code

Visual Studio Code is an open-source text editor created by Microsoft

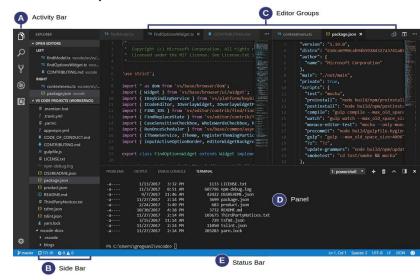

Navigate directory structure, make/remove files, and direct access to the

Terminal/Command Line

Allows you to write text files

 (.py, README.md, etc.) and
 recently, <u>VS Code allows you</u>
 to edit Jupyter Notebooks directly

 Easy to switch between conda environments and lint code

Choose the tools that work for you:

What is *Git*?

Git

- Git is a version control system.
- It's a way of keeping track of all the changes made across your project.
- Think of it like "track changes" in Word but with the ability to track changes across multiple documents.

What is *GitHub*?

GitHub

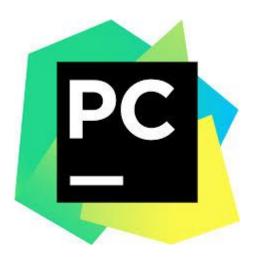

- GitHub is a free software platform that hosts over 40 million developers code
- You'll primarily use GitHub to collaborate with others, document your projects, and build your portfolio to showcase your abilities as a data scientist
- You can also use GitHub for any of the following tasks:
 - Code hosting
 - Code review
 - Project management
 - Team management
 - **Documentation**

Putting it All Together

Go to the "Topic 1: Getting Started with Data Science" Module in the Phase 1 course on Canvas and work through the "Setting up a Professional Data Science Environment" lessons that are appropriate for your OS!

Pycharm: An alternative to VS Code

- Open source IDE (Integrated Development Environment) developed specifically for Python
- Powerful but heavy. Long load time and memory consumption
- Community edition is free
- Specialized features like support for django
